SECURE INITIALIZATION OF INTRUSION DETECTION SYSTEM

ABSTRACT OF THE DISCLOSURE

A system, method and computer readable medium for detecting intrusions is disclosed. The method on a computer includes receiving a behavior profile associated with an application and reading the behavior profile associated with the application. The method further includes monitoring execution of the application, according to the behavior profile. If the behavior of the application does not conform to the behavior profile, a message is issued indicating that the application is not conforming to the behavior profile. The behavior profile can be generated by a developer of the intrusion detection system, a developer of the application, and/or a third party developer. Additionally, the behavior profile is generated by executing the system on a reference computer system or by heuristic determination.
